Workday Spine Score™ — Build Proposal

Integra Health | Sandbox Project Brief

What We're Building

A short scored quiz that helps desk workers self-identify spinal stress patterns — and converts them into $99 Spine Reset bookings at Integra Health.

This is a prototype, not a product. The goal is a working version we can put in front of real people within 7 days and learn from.
Booking destination: book.integraoc.com Suggested platform to explore: Wabi (wabi.ai)

Why It Matters

Right now, most patients arrive at their first appointment with zero context on why they're in pain. This quiz shifts that — they self-diagnose before they ever walk in, which means the first visit becomes confirmation, not persuasion. That's a meaningfully better conversion environment.

Secondary benefit: it runs 24/7, requires no staff time, and can live in an IG bio, QR code at events, or on an iPad in the waiting room.

The Build — What's Needed

1. Quiz Structure (6 questions)

- Sitting hours per day
- Current symptoms (neck, mid-back, low back, headaches, none)
- Screen position relative to eye level
- Slouching frequency
- Movement breaks during the day

- Morning stiffness

2. Scoring Logic

Simple point assignment per answer. Worst habits = highest points. Total range: 0–100+

Three result tiers:

- 🟥 70–100 → High Spinal Stress
- 🟨 40–69 → Moderate Stress
- 🟩 0–39 → Low Stress

3. Result Screen

- Score + tier label
- 2–3 sentence personalized insight (based on answer pattern)
- 3 simple recommendations
- CTA button → book.integraoc.com

4. Lead Capture (if platform supports it)

- First name + email before results are shown
- Feeds into GHL for follow-up

What I'm Providing (Dr. Brock's Contribution)

My input comes in two phases — I stay out of the build until you have structure to react to.

Phase 1 — After initial structure is live:

Once a working skeleton exists (questions loading, scoring functional, result screens rendering), I'll review and provide:

- Result copy in my clinical voice — the 2–3 sentence insight for each tier, written the way I'd actually say it to a patient
- Gut check on question wording — confirming each question sounds like something a real desk worker would recognize about themselves
  CTA copy refinement — the exact headline and button text on the final screen
-

Estimated time from me: 30–45 minutes, delivered as written notes or a voice memo

Phase 2 — After first 10–20 real completions:

- Feedback on what's landing vs. what feels off
- Any copy adjustments based on patient reactions
- Decision on next integration point (IG bio, front desk iPad, events QR code)

What Success Looks Like at Day 14

- Quiz is live and shareable via link
- At least 20–30 completions from real people
- At least 2–3 bookings we can attribute (via intake question: "Did you take our Spine Score?")
- Clear sense of where the drop-off happens in the flow

What This Is Not

- A finished product
- A long-term commitment
- Something that needs to be perfect before launch

Launch ugly. Learn fast. Refine with data.

Timeline

Milestone	Owner	Target
Working prototype live	Builder	Day 1–3
Dr. Brock reviews + provides copy	Dr. Brock	Day 3–4
Final version with real copy	Builder	Day 5–6
Live in IG bio, tested with real people	Both	Day 7
